

Git & GitHub Cheat Sheet for Developers

Phase 1 : Setup

Command	Purpose
git init	Start Git in project
git clone <url>	Download project from GitHub
git remote -v	Show connected GitHub repository

Phase 2 : Check Status

Command	Purpose
git status	Show changed files
git diff	Show exact code changes
git log	Show commit history

Phase 3 : Save Changes

Command	Purpose
git add .	Add all changed files
git add file.js	Add specific file
git commit -m "message"	Save changes locally

Phase 4 : Upload & Download

Command	Purpose
git push origin main	Upload code to GitHub
git pull origin main	Download latest code
git fetch	Check latest remote updates

Phase 5 : Branch Commands

Command	Purpose
git branch	Show branches
git checkout -b feature-login	Create new branch
git switch feature-login	Move to branch

git checkout main	Switch to main branch
-------------------	-----------------------

Phase 6 : Merge

Command	Purpose
git merge feature-login	Combine branch into current branch

Phase 7 : Undo Changes

Command	Purpose
git restore file.js	Remove file changes
git restore .	Remove all uncommitted changes
git restore --staged file.js	Remove file from staging

Phase 8 : Remove / Reset

Command	Purpose
git reset	Undo staging
git reset --hard	Remove all local changes

Phase 9 : Stash

Command	Purpose
git stash	Temporarily save changes
git stash pop	Bring changes back

Phase 10 : Delete Branch

Command	Purpose
git branch -d feature-login	Delete branch

Phase 11 : Helpful Commands

Command	Purpose
git show	Show commit details
git rm file.js	Delete file using Git
git mv old new	Rename file

Most Important Workflow

Clone → Create Branch → Code → Add → Commit → Push → Pull Request → Merge

Daily Workflow Example

```
git status  
git add .  
git commit -m "Updated footer content"  
git push origin feature-footer
```

Important Tips

- Always check git status
- Do not work directly in main
- Use meaningful commit messages
- Create separate branches for features
- Commit frequently
- Review changes using git diff
